

MARVEL FILTERS

FOR SUCTION, RETURN AND LOW PRESSURE LINES

SUMP TYPE FILTERS

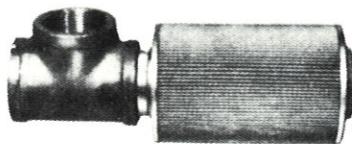

CLEANABLE BONDED SUMP TYPE

Up to 100 gpm—
20 to 200 mesh

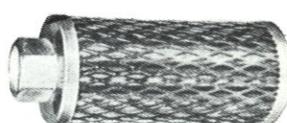

Pages 8, 9, 10

NEW SUMP TYPE WITH THROW-AWAY ELEMENTS

Up to 60 gpm
3, 10 and 20 micron † paper
Page 11

CLEANABLE TAKE-APART SUMP TYPE

Up to 200 gpm—
30 to 200 mesh

Pages 12, 13, 14, 15

[†]Now sometimes referred to as "micro-meter."

LINE AND INLINE TYPES

LINE TYPE
Cleanable
Take-Apart Element

Up to 150 gpm—
30 to 200 mesh—
3/4" thru' 2" pipe
sizes—Pressures
to 80 psi.
Pages 16, 17

LINE TYPE
Cleanable
Take-Apart Element

Up to 300 gpm—
30 to 200 mesh—
2 1/2" and 3" pipe
sizes—Pressures
to 80 psi.
Pages 16, 17

LINE TYPE
Cleanable
Bonded Element

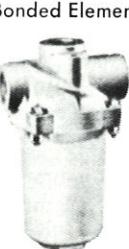

FOR WATER &
SPECIAL FLUIDS
Up to 225 gpm—
20 to 200 mesh—
1" thru' 2 1/2" pipe
sizes—Pressures
to 250 psi.
Pages 18, 19

LINE TYPE
Cleanable
Bonded Element

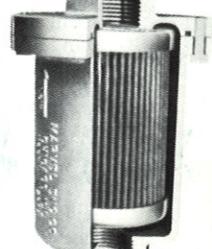

Up to 225 gpm—
20 to 200 mesh—
1" thru' 2 1/2" pipe
sizes—Pressures
to 250 psi.
Pages 20-21

LINE TYPE
Cleanable or
Throw-Away
Bonded Element

Up to 50 gpm—
30 to 200 mesh and
down to 10 micron
paper—1" pipe size
and 1 1/8"—12 straight
thread sizes.
Page 22

Up to 60 gpm—
30 to 200 mesh—
3/4" thru' 2"
sizes in pipe thread,
straight thread and
SAE flange ports.
Pressures to 125 psi.
Page 23

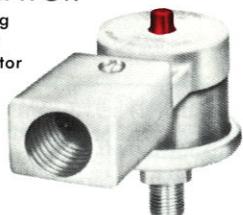

For Hydraulic Oils, Coolants, Lubricants, Fire-Resistant Hydraulic Fluids, Synthetic (Phosphate Ester Base) Fluids, Water and Aqueous Base (Water

Glycol) Fluids. Up to 300 gpm — 10, 25 and 40 Micron Paper — 200 to 20 Mesh — Pressures to 250 psi.

HYDRAULIC FILTERS—GENERAL TYPES AND USES...

Sump or Suction Line Filters provide important, sometimes critical, initial protection for the pump as well as minimal protection for the rest of the hydraulic system. The filter selected should accept the flow of the pump(s) with minimum pressure drop. Many pumps have a maximum suction lift of $2\frac{1}{2}$ to $3\frac{1}{2}$ psi, which indicates pressure drop through filter and intake line should be carefully checked and held low enough to prevent pump cavitation, especially when the filter element has become partially clogged. A vacuum sensing device or other type of suction line element condition indicator should be used to pre-warn of dangerous clogging. (See pages 24 & 25) The pump manufacturer should be consulted to determine maximum tolerable pressure drop and required degree of filtration. The pressure drop tables for lines and fittings, on pages 6 & 7, can simplify analysis. Sump Filters can be manifolded where space problems exist. Tandem Sump Filters (pages 14, 15) provide longer life and require less frequent servicing. They are also recommended for higher flow rates in applications that can tolerate the higher pressure drops as shown in table, page 14. When Sump Filters are used, they should be mounted horizontally a minimum of two inches from bottom of reservoir and at end opposite to system return line. Because of their convenient accessibility for servicing and their easy adaptability to the use of integral element condition indicators, *Suction Line Filters* are recommended over Sump Filters.

Suction Line Filters are mounted outside of the reservoir to simplify cleaning and often employ visual integral indicators. A 200 mesh filter, which will remove particles .003" when clean and smaller when partially clogged, is generally recommended. If finer filtration is necessary (example: fuel transfer systems), finer micron filters should be used, but they must be amply sized to minimize pressure drop and avoid pump cavitation. By-pass valves should be used in sump and suction line filters to eliminate danger of pump cavitation in case filter servicing is neglected. This is true even of indicating type filters for unfortunately they sometimes are neglected. Because of this many such filters also employ an electric warning switch for a visual (light) or audible warning.

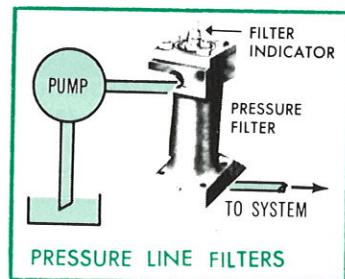

Return Line Filters are used in the main low pressure return lines through which the hydraulic fluid is returned to the reservoir by actuation of a directional control valve(s). The filters must be sized to accept *actual* return oil flow

and not simply on basis of pump capacity. A higher capacity filter will reduce pressure drop and back pressure on system components. Fine filtration is practical in Return Line Filters and a built-in by-pass valve is recommended to prevent element collapse in case filter servicing

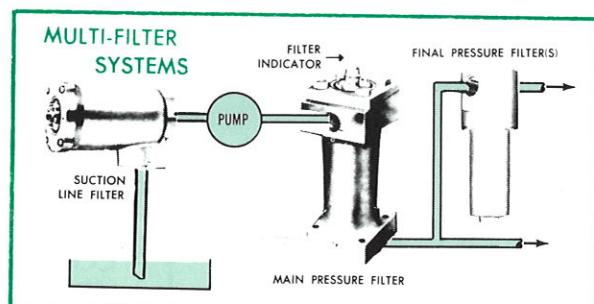

is neglected. Element condition indicators, integral or non-integral with filter, are recommended to protect system by pre-warning of excessive element clogging (see pages 26 & 27). In sizing Return Line Filters, careful circuit analysis is essential where large high pressure actuators are used because sudden flow and shock due to actuator fluid decompression can cause immediate filter element failure.

In long-duration pressure holding applications (such as clamping, mold curing, etc.) where return line oil flow is infrequent, pressure and/or suction line filters are recommended in place of return line filters. This guarantees that filtration is taking place as long as the pump is running.

Filters are often used in the pump's main pressure line to assure the clean, contamination-free oil essential for the proper operation of high precision, extremely close-fitted components such as valves, actuators, etc. Although 25 micron filtration has been recommended in an industry "standard," finer filtration (10 microns or less) is recommended where maximum protection of precision components is required. When the filters are used in high pressure lines, greater pressure drop through the filter can be tolerated. Filter size is dictated by flow rate, degree of system contamination, maintenance intervals, space, weight (in some cases), and economy. Flow capacity of the filter should be as high as possible and, actually, is often sized 2 to 3 times pump capacity. A by-pass relief valve in the filter protects against element damage in case of delayed maintenance and an element condition indicator is a wise and economical precaution against "too soon" or "too late" filter servicing.

PRESSURE LINE FILTERS

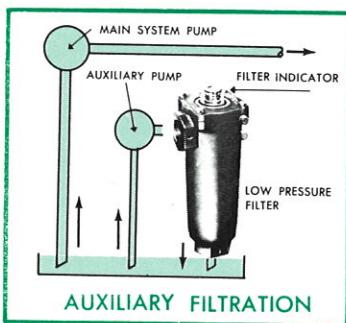

In many applications (such as servo-controlled systems) a suction line filter is inadequate because the extremely fine filtration required (such as 10 micron) is often impractical. In addition normal pump wear can generate harsh, cutting metal contaminants that can quickly damage or foul the precision servo-valve. To attempt to secure, from a single filter, the fine filtration (often 10 micron) necessary for such applications in most cases would be highly impractical from the standpoint of filter cost, size, and weight and could impose too great a load on the pump, with pump cavitation and/or priming problems highly probable. In such cases, the best, most practical solution has often been the use of several filters in the system.

For example: A 74 micron suction filter in the pump intake line for the protection of the pump and initial filtering and a 25 micron pressure filter in the pump pressure line for finer filtration cleanliness. Some systems

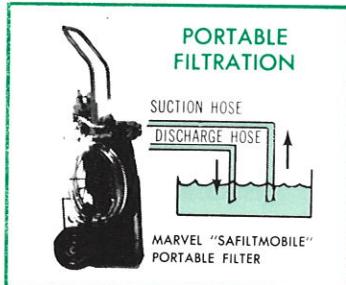

s provided to simplify filter selection and to aid in the selection of the right filter for the particular application.

where superior cleanliness is required employ a 74 micron suction line filter, a 25 micron pressure line filter and, after it in the line, one or more 10 micron pressure filters to protect servo-valve(s) or other precision components sensitive to even small amounts of contamination. Combinations of suction, return line and pressure filters are often the best answer to toughest contamination problems. By dividing the filtering load between them, each filter can do its own job better—a job for which it is specially designed—and its own operation is actually protected and made more efficient by the other filters in the system. Condition indicators and/or warming switches used with or on the filters are the best insurance of proper filter maintenance—by keeping your employees constantly alert to dangerous filter clogging.

AUXILIARY FILTRATION

low pressure circulating pump is continuously operated to force the main system oil through a low pressure filter. Finer filtration is practical and the auxiliary system enables the main system to be operated continuously—with out shutdown for periodic filter cleaning and/or element replacement. This is especially beneficial for expensive machine tools and big-investment production lines where even minutes of downtime can be very costly.

nation damage; cleaning old systems periodically and particularly after system repairs. The portable units are almost mandatory for filling and adding oil to servo-systems and are extensively used on missile systems, where flight weight must be kept to the very minimum and where clean systems are of vital importance.

PRESSURE DROP

The ratio of open area to total area of various mesh sizes is practically the same. Consequently the pressure drop differences between the various mesh sizes are negligible and the pressure drop data on wire mesh elements, as given throughout this catalog, may be used for all 200 mesh and coarser elements. The wide range of mesh sizes available in Marvel Filters enables you to select a degree of filtration for maximum protection of your production equipment. When less than 200 mesh (74 micron) is required, finer wire cloth (which incidentally must be ultrasonically cleaned) and finer disposable paper elements are also available.

BY-PASS VALVES

MARVEL internal by-pass valves for filters are designed to open within $\pm 10\%$ of setting and provide almost full flow

with a minimum pressure drop. The by-pass valves are positioned axially in the flow path. Special settings are available on request and additional production time is incurred. In cases of special requirements, submit complete information to avoid delays. Wherever possible a 25 psi by-pass valve setting is recommended in return line and pressure filters to obtain longest element life.

FLUIDS

The fluid listings shown herein are obviously general since a full compilation of all types, military specifications, brand names and manufacturers would be extremely lengthy. As a typical example, MARVEL filters can be used with more than 50 brands of fire resistant fluids. The number of petroleum base hydraulic fluids would be many times that number. The material used in MARVEL filters has been selected to handle an extremely wide range of fluids and it is often merely necessary to change static seal material for compatible operation. In case of doubt—submit fluid name, number, or identification, viscosity, and manufacturer's name. MARVEL filters can be manufactured for an extremely wide range of fluids such as—oils, coolants, lubricants, phosphate ester or aqueous base fire resistant fluids, water, gasoline, kerosene, turpentine, solvents, fuel oil, diesel fluid, and even paints and waxes. MARVEL filters have been used for preliminary sand exclusion on air systems.

MAGNETS FOR FERRIC PARTICLE REMOVAL (See Page 10)

Better filtration, longer element life, hours saved in servicing . . . with amazing new MarvelMag elements. The harsh, cutting ferric contaminants (that do the most damage to system components) are instantly trapped by complete, outer MarvelMag Magnetic Shield BEFORE they can reach element, keeping it—and entire system—clean, undamaged and functioning at top efficiency for much longer periods without servicing. Ferric particles small enough to pass through element and on into system are most speedily trapped and retained by the all-encircling magnetic shield. Generous flow areas between magnetic rods remain uncluttered, greatly increasing filter efficiency and life. The magnetic rods do not increase element dimensions, providing complete interchangeability of MarvelMag elements with non-magnetic elements. Examples for specifying MarvelMag are given on appropriate pages.

MICRON (MICRO-METER) DATA

General information is lacking on particle sizes and contaminants present in specific industrial systems, machining operations, and production processes. The variables are infinite. Filter users have a working knowledge of contaminants they encounter. This information is often restricted. Degree of filtration is often predicated on the basis of clearance of moving parts, especially valves or pumps, in the system.

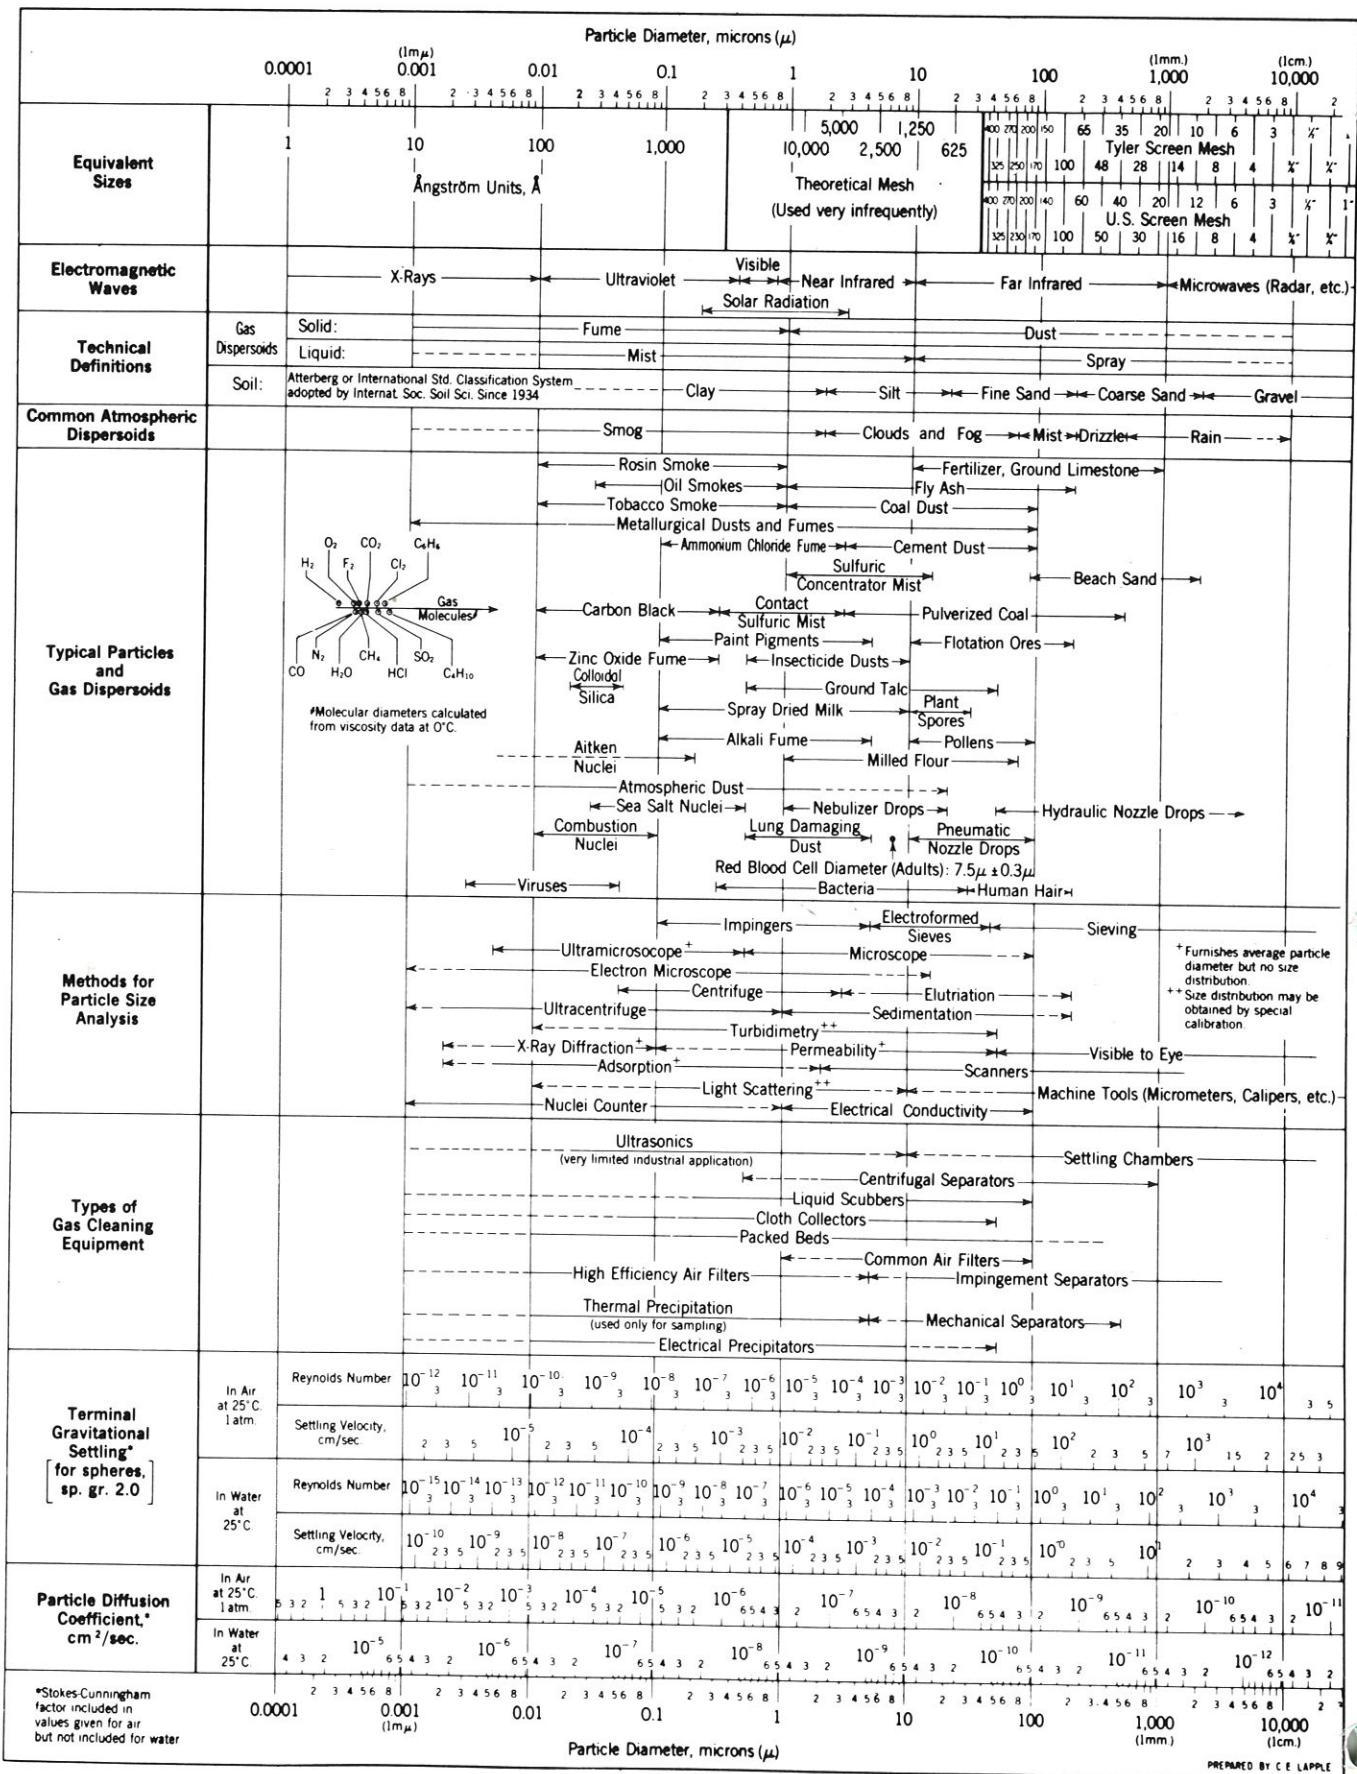

The following chart on page 4, "CHARACTERISTICS OF PARTICLES AND PARTICLE DISPERSOIDS" prepared and reproduced through the permission of the STANFORD RESEARCH INSTITUTE provides a comprehensive summary of filtration and pertinent factors.

The actual mesh sizes available in MARVEL filters, along with the companion micron ratings, are shown. Obviously, the 150 and 200 mesh sizes are too small for reproduction, and would only appear as solid. (See Page 5).

SPECIAL FILTERS

Quite often it is possible to utilize a filter element assembly or a combination of existing parts to obtain the desired results. Invariably, a complete exchange of all pertinent information is necessary to solve specials economically and expediently.

CHARACTERISTICS OF PARTICLES AND PARTICLE DISPERSOIDS

Reprinted from Stanford Research Institute Journal, Third Quarter, 1961. Single copies \$1/2 by 11 inches. Both charts available from Dept. 300.

Marvel Cleanable Synclinal Filters are equipped with Stainless Steel or Monel Wire Cloth Elements. The filtering insert elements are available from a coarse 20 mesh up to a fine 200 mesh. To better illustrate mesh sizes, we have shown below the actual size mesh of the 100, 80, 60, 50, 40, and 30 wire cloth. 10, 15, 25 and 40 micron wire cloth is available. In addition 10, 25 and 40 micron pleated, specially treated paper elements, are available.

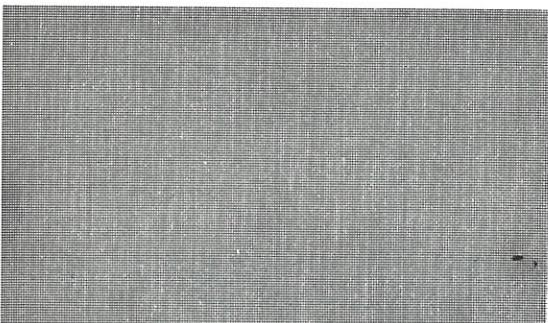

100 MESH

Wire Diameter .0045
Width of Opening .0055 = 141 Microns

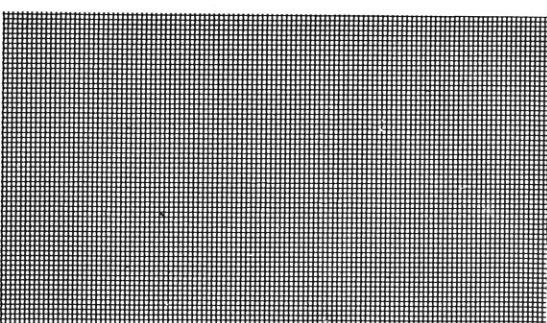

50 MESH

Wire Diameter .0080
Width of Opening .0120 = 308 Microns

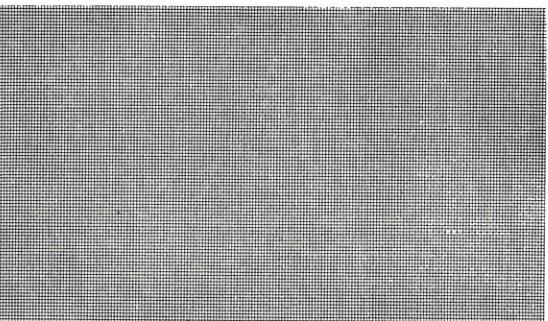

80 MESH

Wire Diameter .0055
Width of Opening .0070 = 180 Microns

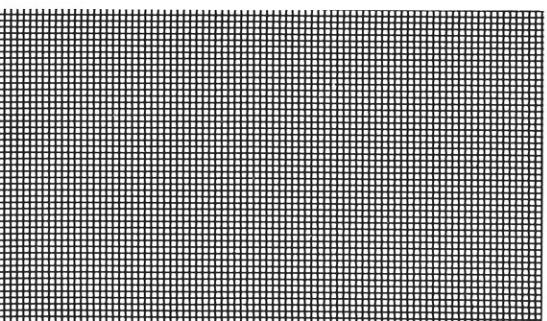

40 MESH

Wire Diameter .0100
Width of Opening .0150 = 385 Microns

60 MESH

Wire Diameter .0065
Width of Opening .0102 = 262 Microns

30 MESH

Wire Diameter .0120
Width of Opening .0213 = 546 Microns

150 MESH

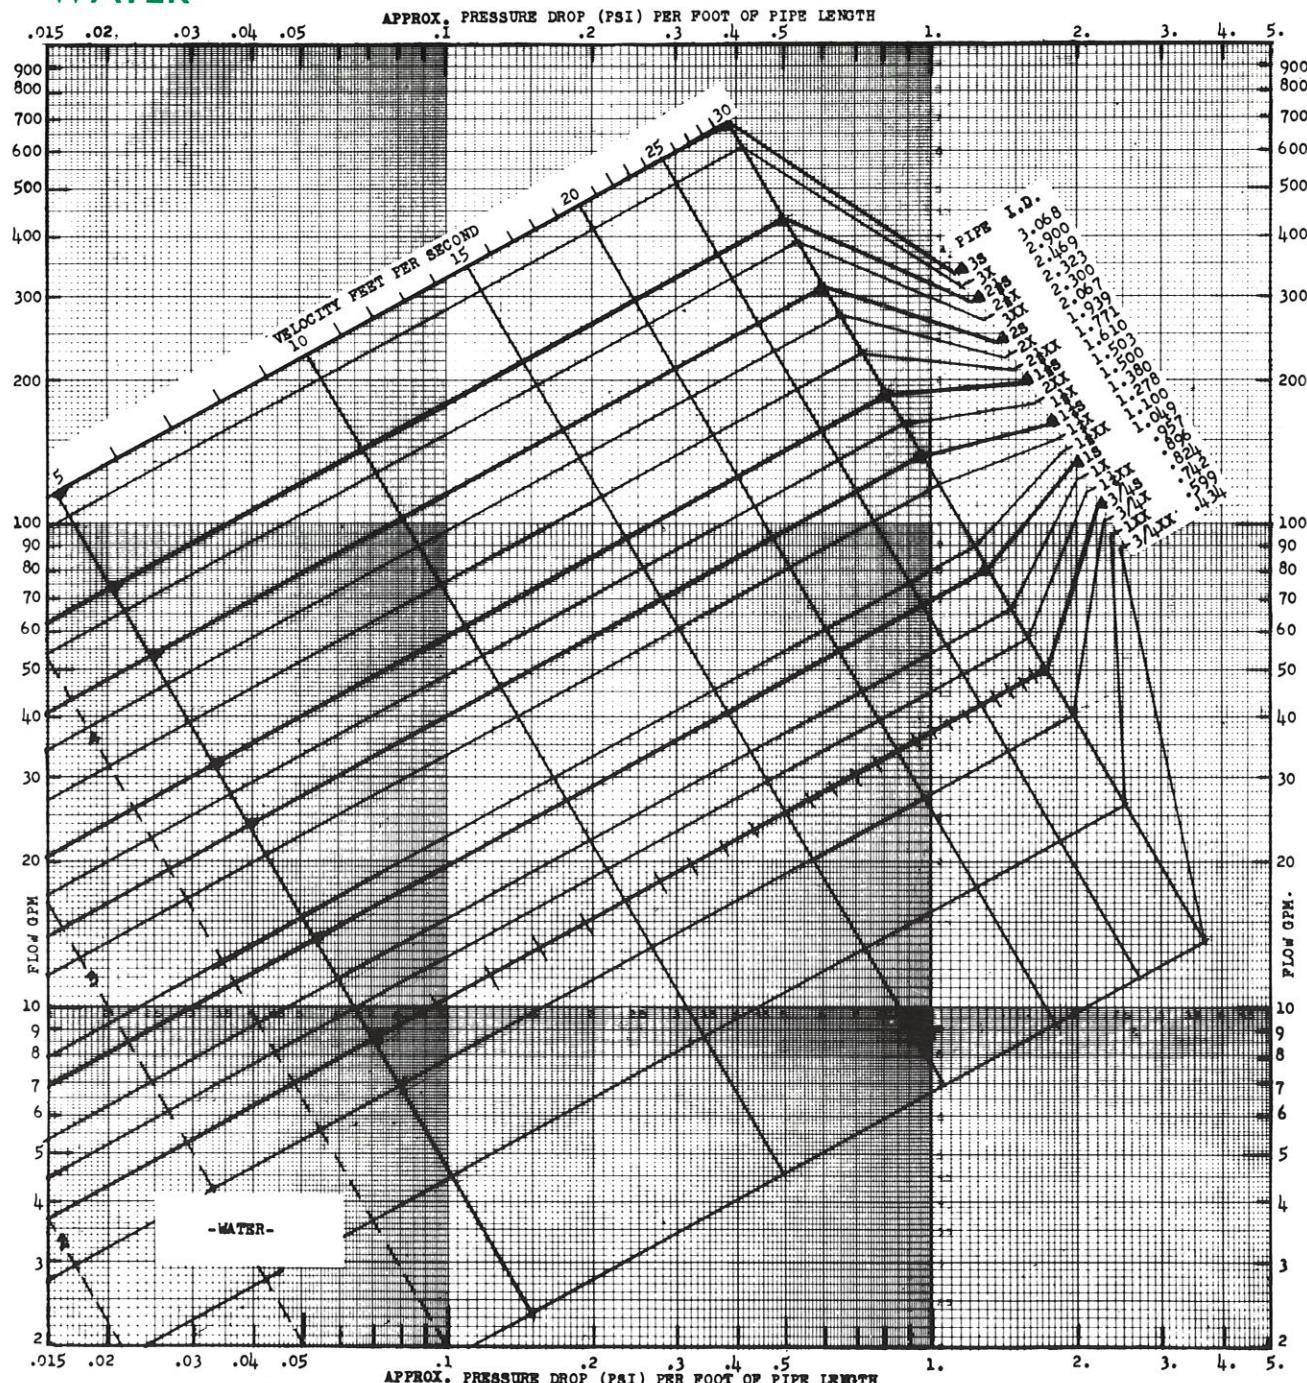

Wire Diameter .0026
Width of Opening .0041
Microns = 105

200 MESH

S = Standard weight pipe. X = Extra strong. XX = Double extra strong.

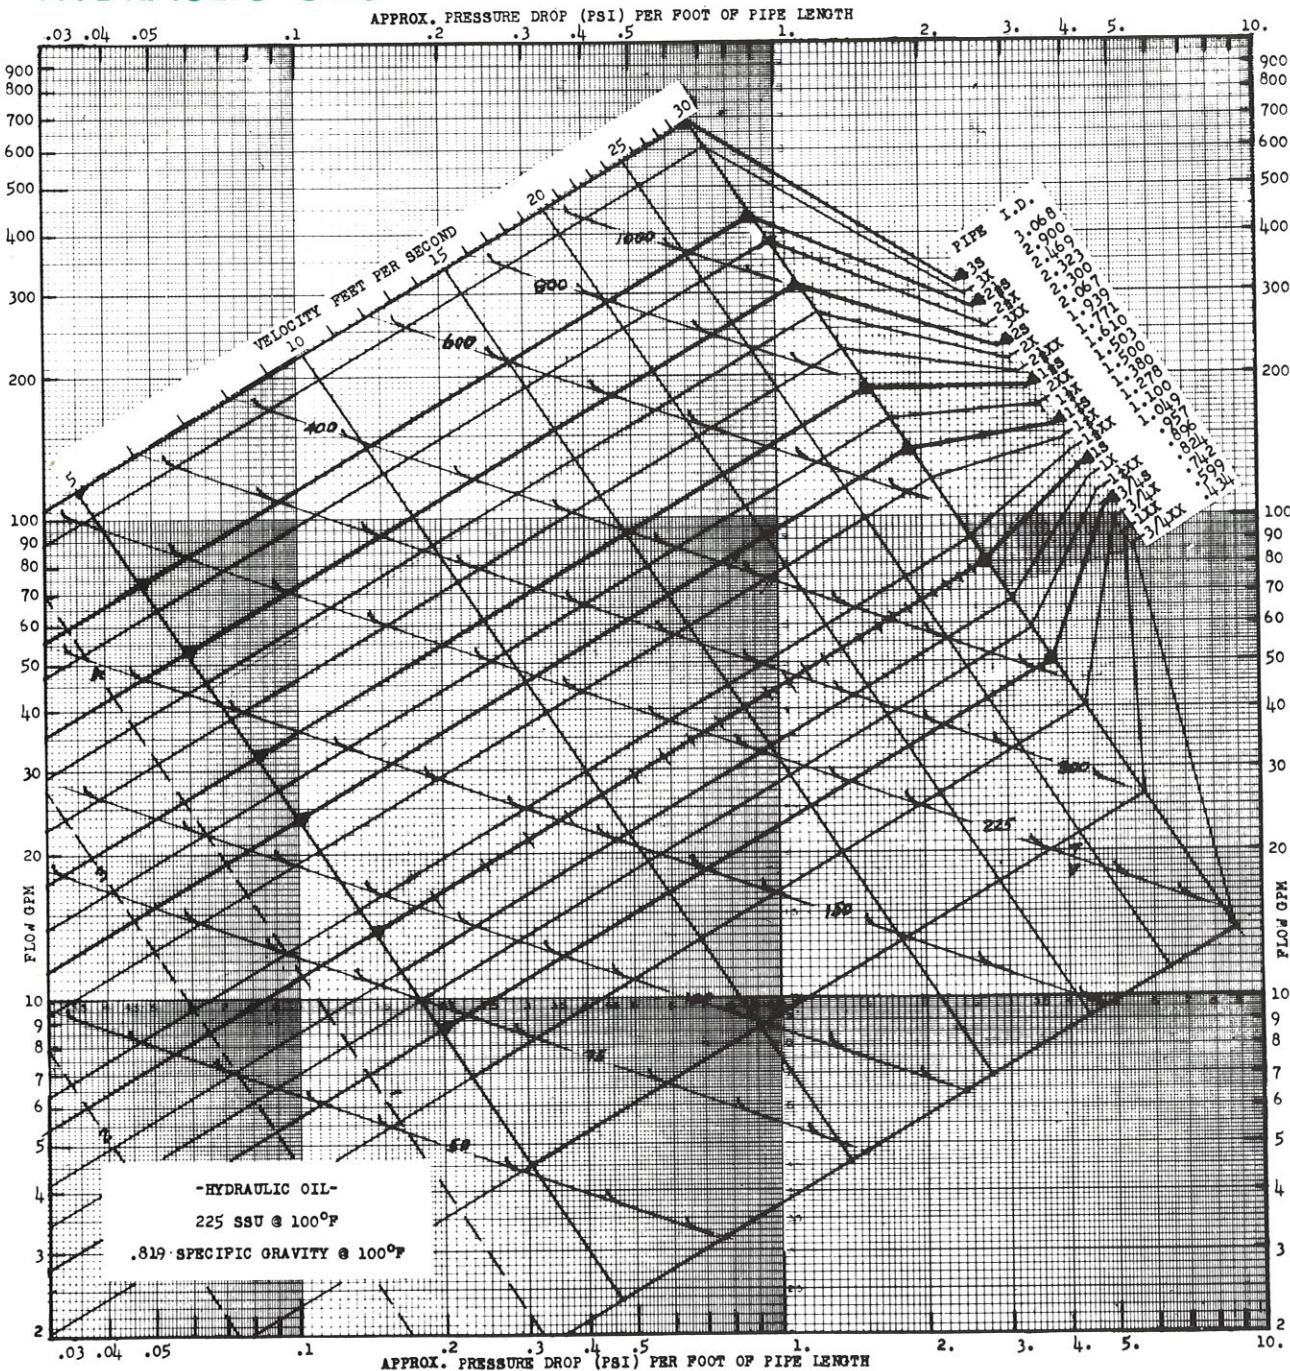

(P_λ) = Pressure drops have been derived from the rational formula — $P_\lambda = \frac{.323 f S L v^2}{d}$

(G.P.M.) = Gallons per minute have been derived from the rational formula — $G = .431 \sqrt{\frac{P_\lambda d^5}{f S L}}$

(f) = Friction factors from "Piping Handbook"; 4th Ed., Fig. 15a

Data shown is for butt welded clean steel pipe. Use line I.D. interpolation for steel tubing. The numbered lines indicate the demarcation zone between viscous and turbulent flow for the stated SSU. Viscous flow for each SSU is below that line and turbulent flow above it. The pressure drops for 75 SSU and higher viscous flow is in direct proportion to SSU and Specific Gravity. Example—150 SSU oil in viscous flow zone will give pressure drops of 150/225 or two thirds of the values shown on Page 11. Turbulent pressure drops will be greater than the direct proportion. (See Piping Handbook, Crocker, McGraw-Hill Book Co.)

HYDRAULIC OILS

Pressure drop can be minimized by using short large lines with a minimum number of fittings. Check with pump and valve manufacturers to determine the proper SSU to avoid cavitation and excessive pressure drop on cold starts and give adequate lubrication when the fluid reaches maximum system temperature. Fluid manufacturer's temperature-viscosity charts can be very helpful to determine viscosity changes.

BONDED SUMP TYPE—UP TO 100 GPM—1" THRU 3" PIPE SIZES

WITH OR WITHOUT BY-PASS VALVE

For Use With Hydraulic Oils, Coolants, Lubricants and Fire Resistant Fluids.

For use with regular petroleum base Hydraulic Oils, Coolants, Lubricants and all types of Fire-resistant Hydraulic Fluids and water.

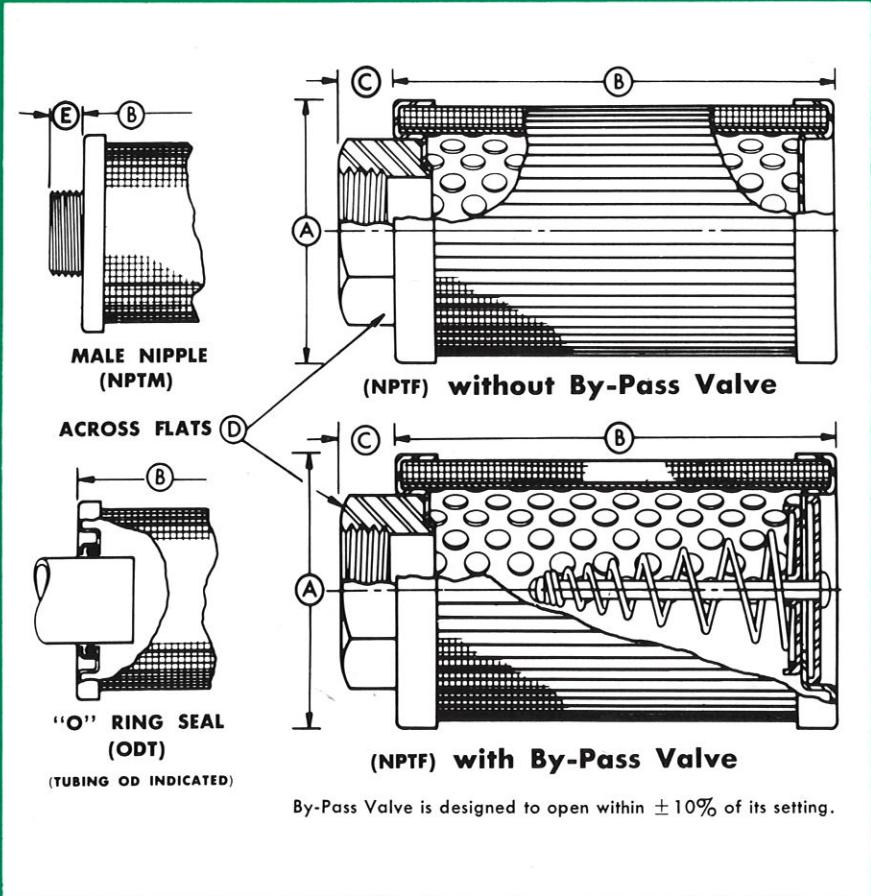

CAPACITIES:
10 - 20 - 30 - 50 - 75 - and 100 GPM.

PIPE SIZES:
1" - 1 1/4" - 1 1/2" - 2" - 2 1/2" and 3" NPT male and female as well as "O" ring seal.

OPERATING TEMPERATURES:
Up to 300° F.

HOW TO CLEAN:

Remove Filter Element from suction line, swish element in any non-caustic clean solvent for a short period of time (Caution: Do not leave element in solvent). A stiff fibre brush may be used, if necessary, to remove impacted deposits between wire cloth serrations. Shake off excess solvent. If compressed air is available, blow dry from inside out.

By-Pass Valve is designed to open within $\pm 10\%$ of its setting.

* 100 MESH STANDARD

**STANDARD BY-PASS

NOTE: To specify MarvelMag Magnetic Filters, insert "M" in Model No. Example: 410-100 becomes "410M100." To order Replacement Element only pleated for magnets but less the magnets, change "M" in Number to "MN", making it, in example, "410MN100."

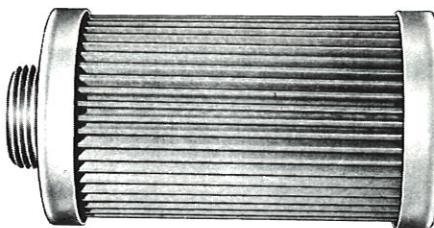

BONDED SUMP TYPE—ALL STAINLESS STEEL

MARVEL FILTERS

FOR WATER AND SPECIAL FLUIDS—1000 SERIES—(NO BY-PASS)—Operating Temperatures: Up to 300°F

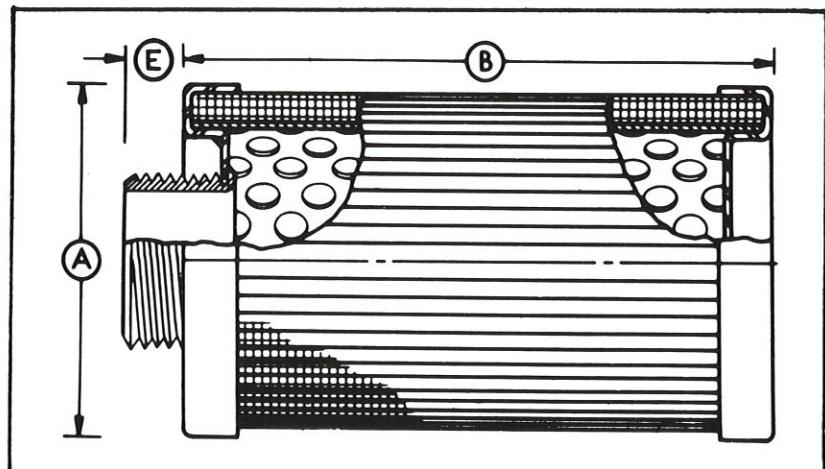

CAPACITIES:
Up to 75 GPM

PIPE SIZES:
1" through 2½"

To Clean:

Follow same simple cleaning procedures as described on page 8.

UNIQUE MARVELMAG MAGNETIC SHIELD

protects entire hydraulic system from those everpresent ferric contaminants

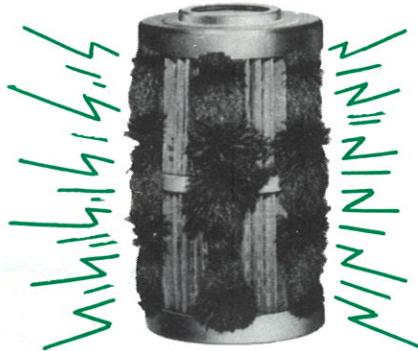

Photo shows amazing effectiveness of MarvelMag magnetic rods in trapping ferric particles, yet leaving large element flow areas that assure continuous full-flow filtration.

Better filtration, longer element life, hours saved in servicing . . . with amazing new MarvelMag elements. The harsh, cutting ferric contaminants (that do the most damage to system components) are instantly trapped by complete, outer MarvelMag Magnetic Shield BEFORE they can reach element, keeping it—and entire system—clean, undamaged and functioning at top efficiency for much longer periods without servicing. Ferric particles small enough to pass through element and on into system are most speedily trapped and retained by the all-encircling magnetic shield. Generous flow areas between magnetic rods remain uncluttered, greatly increasing filter efficiency and life. The magnetic rods do not increase element dimensions, providing complete interchangeability of MarvelMag elements with non-magnetic elements. Examples for specifying MarvelMag are given on appropriate pages.

200	1010-200	1020-200	1030-200	1050-200	1075-200

NOTE: To specify MarvelMag Magnetic Filters, insert "M" in Model Number. Example: 1010-60 becomes "1010M60." To order Replacement Element pleated for magnets but less the magnets, simply change "M" in Number to "MN", making it, in example "1010MN60."

OVERLAPPING MAGNETIC FIELDS

The individual magnetic rods are full filter element length and their unique design provides powerful magnetic fields along entire length of element. The rods are equally spaced around exterior surface of element so that their magnetic fields overlap to cover full element circumference. This provides a complete magnetic shield around the outer (upstream) side of element in the area of lowest fluid velocity—where ferric particles are most effectively trapped and retained and where overall filtering efficiency is at maximum.

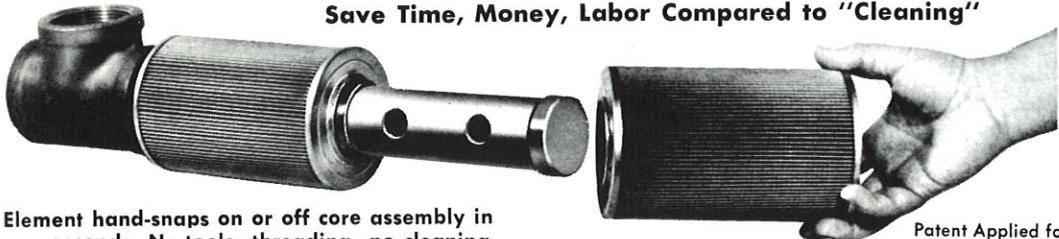

SO EASY TO SERVICE!

"Lay-in . . . Lift-out" Magnetic rods. MarvelMag Shield is formed by individual magnetic rods placed in grooves on outer surface of Synclinal element. To clean rods, just lift out, wipe off, and lay them back in grooves. Slip-on spring clip keeps rods from being magnetically dislodged accidentally.

NEW SUMP FILTERS with QUICK-CHANGE THROW-AWAY ELEMENTS

Save Time, Money, Labor Compared to "Cleaning"

Element hand-snaps on or off core assembly in seconds. No tools—threading—no cleaning.

Says the maintenance supervisor of a large industrial plant: "We don't clean our sump filters. We just throw them away because the labor costs (not to mention the time loss) of cleaning are substantially higher than our costs for whole new filters. In this way, too, we are always sure of starting anew with a 100% contamination-free element."

Even if you don't throw away your cleanable sump filters, Marvel's new Sump Filters with Throw-Away Elements assure substantial savings. No need to waste time, money, and labor in removing, cleaning and re-installing entire filter. You just throw away the used element and hand-snap on a new, fresh element—all in few seconds. And the cost of these Marvel

Patent Applied for

Throw-Away Elements is a small fraction of the cost of cleanable elements. The Throw-Away elements are "O" ring sealed in place and provide 20 micron and finer filtration. Compare this fine filtration with the 141 micron filtration common to sump strainers. Very low pressure drop and generous size By-Pass Valve of New Filter assure long element life with elimination of pump cavitation danger.

Filters available in standard length, extended length, and double length element models. Recommended for use with Marvindicator as shown in circuits, page 13.

NOTE: Quick-Change Cleanable Elements (hand-snap on and off) also available.

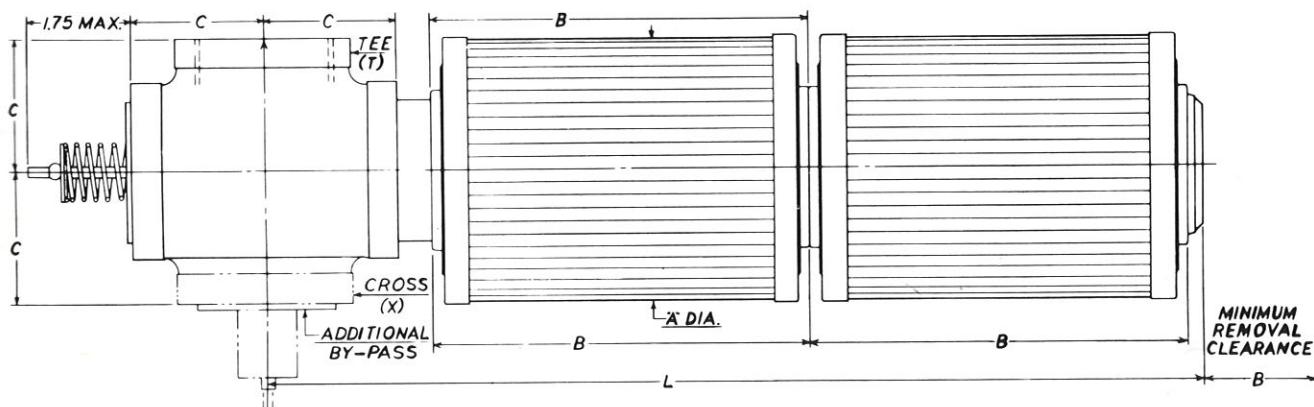

TABLE I—GPM CAPACITIES

At Different By-Pass Settings and Micron Ratings—based on 1 psi or less pressure drop with clean element and 225 SUS Petroleum Oil. For Phosphate Ester Fluid, use 65% of GPM capacities shown; 80% for Water Glycol.

7110	10	10 MICRON PAPER
7120	20	20 MICRON PAPER

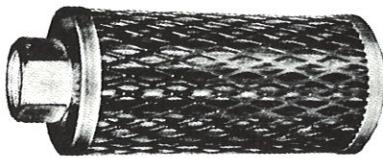

EXAMPLE: A 25 gpm, 2 psi By-Pass, 20-micron Filter, Tee Fitting Type for Petroleum Oil is specified by the following:

(a) (b) (c) (d)
063201T0200-666266-7120

Reading horizontally to right from Element No. in Table II to Table III gives you the Port Sizes and Dimensions of Filter. To specify above filter with Magnetic Element, change dash in Element No. to "M" making it "666266M7120." To order Replacement Elements only, specify Element and Media Nos. (c & d) only. To order Replacement Element pleated for magnets but less the magnets, change "M" in Magnetic Element Number to "MN", making it, in above example, "666266MN7120."

TAKE-APART SUMP TYPE—UP TO 100 GPM— $\frac{3}{4}$ " THRU 3" PIPE SIZES

Use with "Marvindicator" Element Condition Indicator (See pages 24 & 25)

CAPACITIES:

5—8—10—20—30—50—75 and
100 G.P.M.

PIPE SIZES:

$\frac{3}{4}$ "—1"— $1\frac{1}{4}$ "— $1\frac{1}{2}$ "—2"— $2\frac{1}{2}$ "
and 3".

CONNECTIONS:

Coupling—Male Nipple.

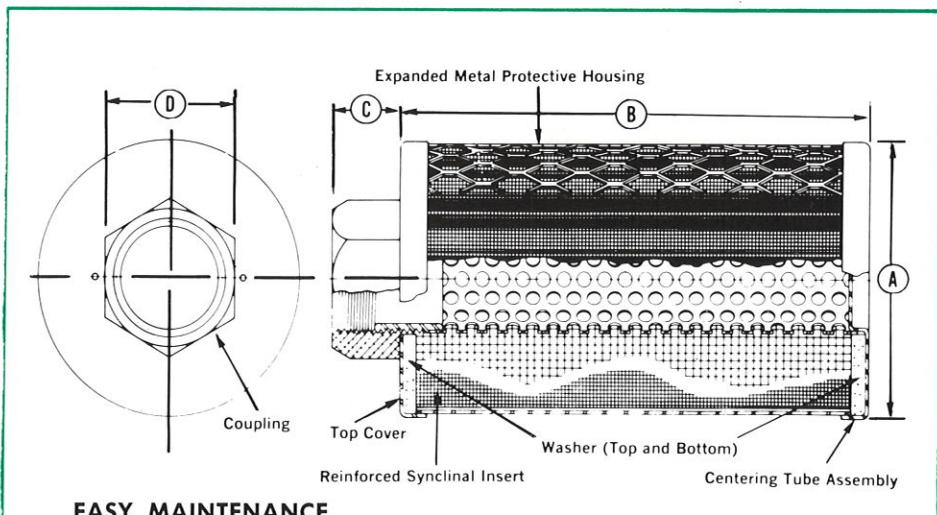

BY-PASS VALVE:

Not available.

OPERATING TEMPERATURES:

Up to 150° F. Also available
on special order for higher
temperatures.

For use with regular
petroleum base Hydraulic
Oils, Coolants, Lubricants,
all types of Fire-resistant
Hydraulic Fluids and Water.

EASY MAINTENANCE

These Sump Type Filters may be disassembled, thoroughly cleaned and reassembled in a matter of minutes. Require no replacement or "throw-away" parts to purchase or carry in stock. See bottom of page No. 15 for cleaning instructions.

NOTE: To specify MarvelMag Magnetic Filters, insert letter "M" in Model Number. Example: A-2 1/2-75-100 becomes "A-2 1/2-75M100"

TYPICAL SUMP TYPE INSTALLATION

TYPICAL SINGLE UNIT INSTALLATION

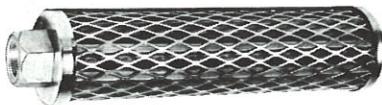

"Marvindicator" Vacuum Sensing Element Condition Indicator most convenient and practical for sump filters because it requires only one pipe connection (see pages 24 & 25). It indicates when element must be serviced.

TYPICAL MULTIPLE UNIT INSTALLATION

TANDEM TAKE-APART SUMP TYPE—UP TO 200 GPM— $\frac{3}{4}$ " THRU 3" PIPE SIZES

Use with "Marvindicator" Element Condition Indicator (See pages 24 & 25)

The tandem sump filters can be used at rated flow where the pressure drop is not excessive. Where pressure drop is high the tandem units should only be used at reduced flow and consequent reduced pressure drop, but obtaining extended time intervals between cleaning operations.

PIPE SIZES:

$\frac{3}{4}$ "—1"— $1\frac{1}{4}$ "— $1\frac{1}{2}$ "—2"— $2\frac{1}{2}$ " and 3"

CONNECTIONS:

Coupling—Male Nipple.

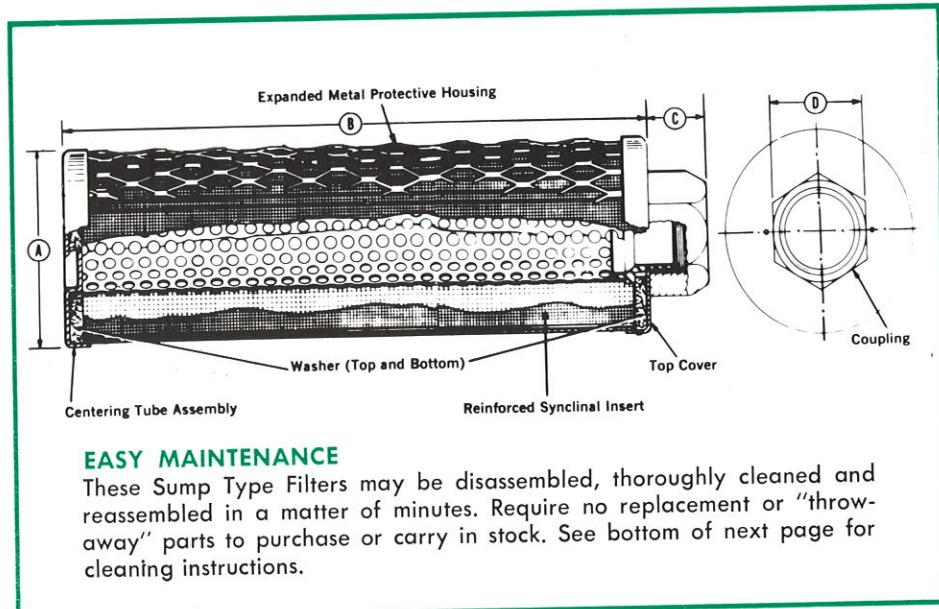

BY-PASS VALVE:

Not Available.

OPERATING TEMPERATURES:

Up to 150° F. Also available on special order for higher temperatures.

For use with regular petroleum base Hydraulic Oils, Coolants, Lubricants and all types of Fire-resistant Hydraulic Fluids and water.

EASY MAINTENANCE

These Sump Type Filters may be disassembled, thoroughly cleaned and reassembled in a matter of minutes. Require no replacement or "throw-away" parts to purchase or carry in stock. See bottom of next page for cleaning instructions.

* STANDARD MESH

NOTE: To specify MarvelMag Magnetic Filters, insert letter "M" in Model Number. Example: 90100-100 becomes "90100M100".

TYPICAL SUMP TYPE INSTALLATIONS

Recommended to be installed on suction intake pipe in reservoir in a horizontal position with outer diameter of filter approximately 2 inches above bottom. Two or more units may be used by multiple or manifold installation where space limitations prevent use of a larger single unit to handle greater capacities.

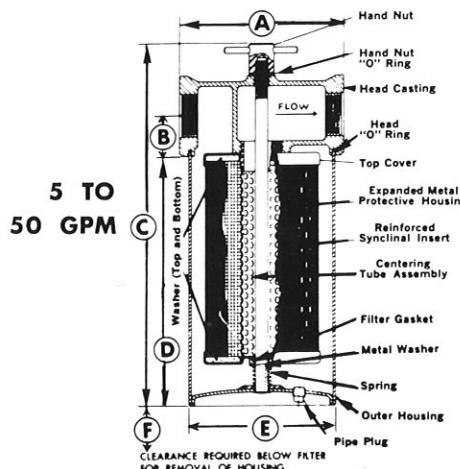

WHEN TO CLEAN FILTER

Recommended practice is to use a vacuum sensing device, such as the "Marvindicator" which provides a Red "Pop-Up" Button plus (if desired) warning lights and/or audible alarms, activation of which means "clean or replace element at once."

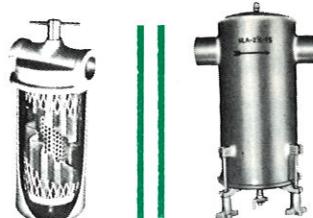

To Clean Filter Elements:

First remove filter coupling—then follow steps 4, 5, 6, and 7 of cleaning instructions on page 17. Use hand pressure only when replacing coupling. Do not use wrench.

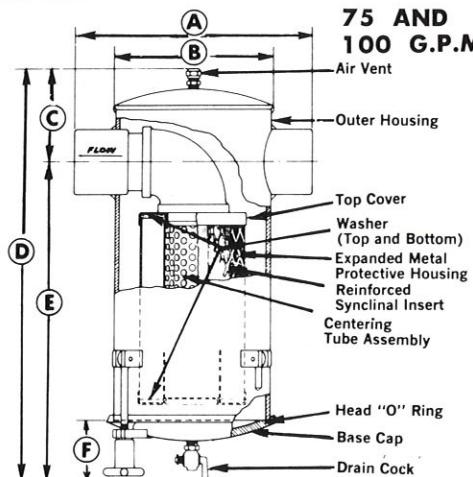

LINE TYPE WITH TAKE-APART ELEMENT—UP TO 300 GPM—PRESSURES TO 80 PSI

5 TO
50 GPM

75 AND
100 G.P.M.

BY-PASS VALVE:
Not available.
OPERATING PRESSURES:
Up to 80 p.s.i.
OPERATING TEMPERATURES:
Up to 150°F. Available on special order for higher temperatures.
(For gallon capacities see Note 1 on page 17)

*STANDARD MESH.

NOTE (1): GPM capacities shown are maximum rating for suction applications only. For return and low pressure line applications, the filters may be used at 2 to 3 times the capacities shown depending upon allowable pressure drop.

NOTE (2): To specify MarvelMag Magnetic Rods in filter, insert "M" in Model Number, Example: SLA-1 1/2-30-60 becomes "SLA-1 1/2-30M60."

EASY TO CLEAN
Requires No Throw-Away Parts to Purchase or Carry in Stock

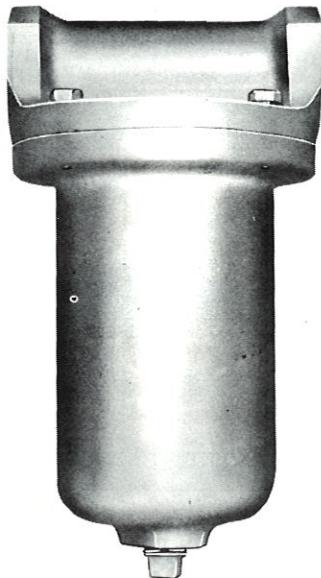

**TO REASSEMBLE—SIMPLY REVERSE PROCEDURE
CAUTION!**

Check "O" RINGS, WASHERS and FILTER GASKET for wear and replace with new parts if necessary. Be sure TENSION SPRING, METAL WASHER and FILTER GASKET are replaced in proper sequence on outer housing center rod. (See cutaway drawing). USE HAND PRESSURE ONLY when replacing HAND NUT. DO NOT USE WRENCH!

1300 SERIES - FOR SUCTION, RETURN AND LOW PRESSURE LINES

For Use With Water or Special Fluids

(For gallon capacities see
Note 1 on page 19)

**BRASS HEAD AND HOUSING — ALL
STAINLESS STEEL WIRE CLOTH
FILTER ELEMENT — ALL STAINLESS
STEEL BY-PASS OPTIONAL.**

CAPACITIES: 10—20—30—50 and 75 G.P.M.

PIPE SIZES: 1"—1½"—1½"—2" and 2½".

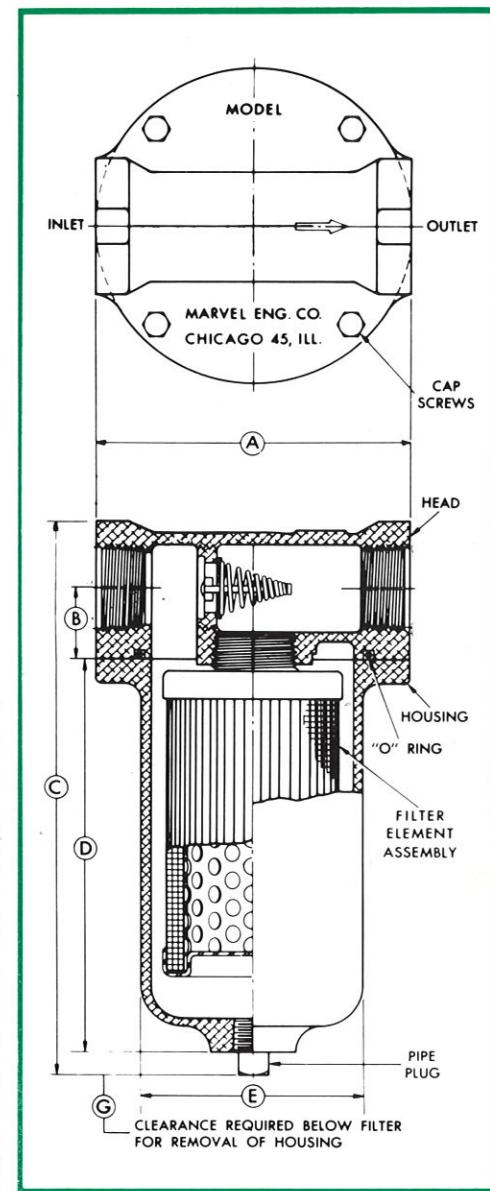

BY-PASS VALVE: Available with or without.

OPERATING PRESSURE: Up to 250 p.s.i.

OPERATING TEMPERATURES: Up to 275° F.

* 100 MESH STANDARD

NOTE (1): GPM capacities shown are maximum rating for suction applications only. For return and low pressure line applications, the filters may be used at 2 to 3 times the capacities shown depending upon allowable pressure drop.

NOTE (2): To specify MarvelMag Magnetic Rods in Filter, insert "M" in Model Number. Example: 1320-HB-100 becomes "1320-HBM100." To order Standard Replacement Element, specify No. 1020-100 (see part numbers—page 18). To order Element with Magnets, specify No. 1020M100. To order Replacement Element only, pleated for magnets but less the magnets, change "M" in Number to "MN", making it, in example "1020MN100."

WHEN TO CLEAN FILTER

A filter element condition indicator (such as the "Colorgage" Indicator, pages 26 & 27) is recommended for use with non-indicating filters to advise when cleaning is required. Caution: Make sure the operating fluid is compatible with Colorgage. If no indicator is used, proper maintenance of non-indicating filter becomes more difficult and must be based on trial and error guesswork methods, bearing in mind the following considerations:

Frequency of filter cleaning varies and is dependent upon the conditions under which equipment is operating. Recommended procedure is to establish a filter maintenance schedule based on your experience. Once this schedule is established, it should be adhered to without deviation. The little time required to clean the filter pays off in the efficient operation of your equipment and provides constant protection to the hydraulic system.

1500 SERIES - FOR SUCTION, RETURN AND LOW PRESSURE LINES

For use with regular petroleum base
Hydraulic Oils, Coolants, Lubricants and
all types of Fire-resistant Hydraulic Fluids
and water.

**ALUMINUM HEAD
ALUMINUM HOUSING
MONEL FILTER ELEMENT**

CAPACITIES: 10—20—30—50 and 75 G.P.M.

PIPE SIZES: 1"—1½"—1½"—2" and 2½".

BY-PASS VALVE: Available with or without.

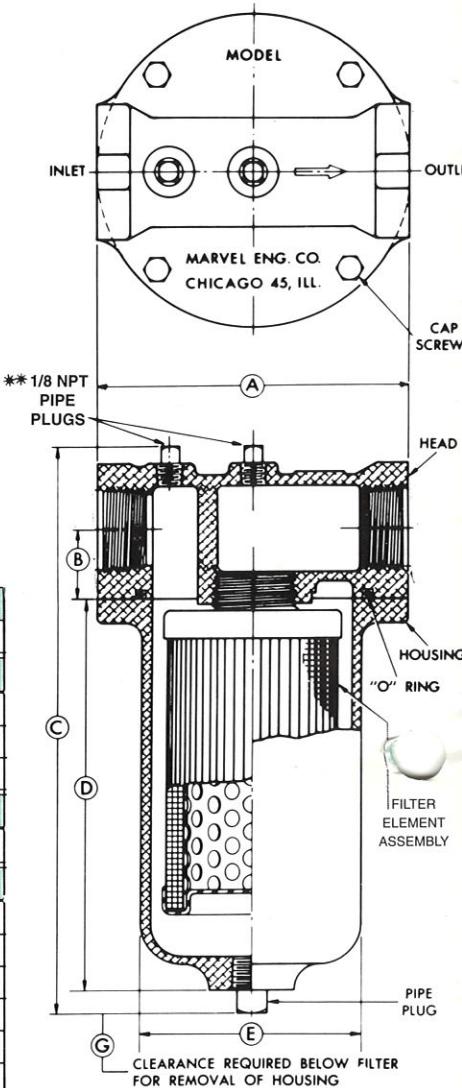

OPERATING PRESSURE: Up to 250 p.s.i.

OPERATING TEMPERATURES: Up to 300° F.

(For gallon capacities see
Note 1 on page 21)

Note (1): GPM capacities shown are for suction applications only. For return and low pressure line applications, the filters may be used at 2 to 3 times the capacities shown depending upon allowable pressure drop.

Note (2): To specify MarvelMag Magnet Rods in Filter, insert "M" in Model Number. Example: 1510-HB5-100 becomes "1510-HB5M100." To order Standard Replacement Element specify part No. 310-100. (See part no. table, page 20). To order Replacement Magnetic Element, specify No. 310M100. To order Replacement Element Pleated for Magnetic Rods but less the rods, simply change M in number to MN making it, in above example, Element No. 310MN100.

BONDED LINE TYPE—WITH CLEANABLE OR THROW-AWAY ELEMENT

EXTRA OUTLET PORT (AT TOP) AND (OPTIONAL) $\frac{1}{8}$ " PORTS FOR "COLORGAGE" INDICATOR

Up to 50 GPM
Up to 150 PSI
1" NPTF and
 $1\frac{5}{16}$ " — 12
Ports.

OPTIONAL PORTS FOR "COLORGAGE"

For added convenience in protecting this filter with a Colorgage Element Condition Indicator (see pages 26, 27), you may order the filter with (optional) $\frac{1}{8}$ "—27 NPTF Gage Ports at "N" or "R" (see drawings at right) for connecting filter directly to Colorgage quickly and easily. To indicate this option on your filter order, simply replace the first dash (—) in filter model no. with the letter "N" (Normal) or "R" (Reverse). Example: Filter Model No. 151161-2500-529206-7110 becomes "151161N2500-529206-7110" (indicating upstream and downstream gage ports at "N" positions).

TABLE II—BY-PASS OPTIONS

25 psi By-Pass Setting recommended for most applications.

25 psi By-Pass, ADD 2500 to Housing No.	
15 psi By-Pass, " 1500 "	
10 psi By-Pass, " 1000 "	
8 psi By-Pass, " 0800 "	
5 psi By-Pass, " 0500 "	
3 psi By-Pass, " 0300 "	
No By-Pass, " 0000 "	

TABLE I—MARVELINE-TB HOUSING & FILTER ELEMENT NUMBERS

PORT POSITIONS	GROUP A HYDRAULIC OILS—COOLANTS—LUBRICANTS—WATER GLYCOL			GROUP B PHOSPHATE ESTER BASE FLUID	
	(1) NPTF	(2) SAE ST. TH'D.	(3) HOUSING NUMBERS	(4) FILTER ELEMENT NUMBERS	(5) HOUSING NUMBERS

SELECTING FILTER NUMBER

Complete Filter Model Number consists of the following:

- Housing Number for fluid to be filtered. Select from Table 1 Column 3 or 5.
- By-pass Number, from Table II.
- Filter Element Number for fluid selected, from Table 1, Column 4 or 6.
- Filter Element Media Number for desired degree of filtration, from Table III.

EXAMPLE:

A Filter with 1 $\frac{5}{16}$ "—12 SAE Straight Thread Ports for Petroleum Oils, Return Line Installation, 200 Mesh Monel, Element and 25 psi By-pass . . . is specified by the following:

(a) (b) (c) (d)
Filter No. 155162-2500-529206-1220
(Housing Number) (Element No.)

To specify above filter with Magnetic Element, simply change dash in Element Number to "M", making it "529206MN1220".

Note: To order Replacement Elements only, simply specify Element Number only. To order Replacement Element pleated for magnets but less the magnets, simply change the "M" in Magnetic Element Number to "MN", making it, in above example, "529206MN-1220".

INLINE TYPE

CAPACITIES:

Up to 20 GPM Up to 125 PSI Max.

PIPE SIZES:

(at both inlet and outlet) $\frac{3}{4}$ " and 1" NPTF.

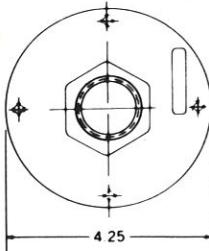

BY-PASS VALVE:

Available with or without By-Pass Valve.

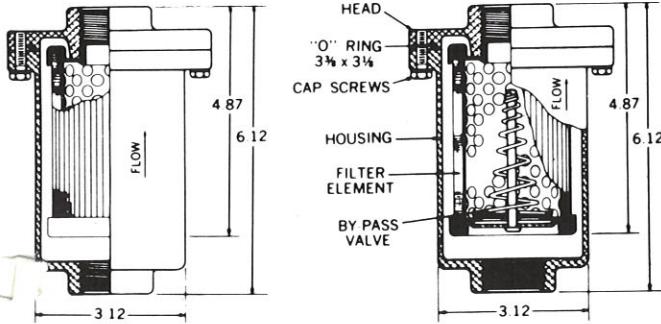

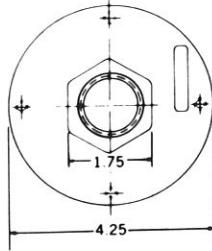

OPERATING TEMPERATURES:

Up to 275° F.

2032 SERIES (No By-Pass Valve)

2032B SERIES (With By-Pass Valve)

NOTE: Pressure Drops at right based upon Petroleum Base Oil 225 SSU (@ 100°F., $\frac{3}{4}$ " NPTF Filter.

Example: 831 becomes "831M".

MARVINDICATOR—ELEMENT CONDITION INDICATOR FOR SUMP AND SUCTION

FOR USE WITH HYDRAULIC OILS, COOLANTS, LUBRICANTS, WATER GLYCOL FLUIDS, AND WATER

RED BUTTON POPS UP

to indicate dangerous element clogging—allowing element cleaning or replacement BEFORE any damage can result.

Electrical Connections for audio signals and/or warning lights also provided (However, many users find the attention-compelling Red Pop-Up Button a sufficient warning signal).

Eliminates "guesswork" in element servicing intervals.

Prevents damaging pump cavitation

Assures 100% oil filtration

MARVINDICATOR—VACUUM SENSING AND SIGNALLING INDICATOR

Too soon servicing of filter elements is costly in wasted maintenance, manpower, material, and downtime. Too late servicing can be even more costly, resulting in:

1. Dirty, unfiltered oil flooding entire system when filters with integral by-pass valves are employed.
2. Dangerous pump cavitation in systems employing filters without integral by-pass valves.
3. Expensive downtime for repairs and replacements.

Eliminate these problems by installing the Marvindicator in your sump and/or suction lines as illustrated below. Economical in cost and proven in years of field service, the Marvindicator takes the guesswork out of element servicing intervals. It tells precisely when servicing is needed by providing attention-compelling warning signals responsive to preordained degrees of vacuum, thus indicating any existing dangerous condition in both the filter and suction lines. Any excessive obstruction in either causes Marvindicator's highly visible Red Button to pop up to

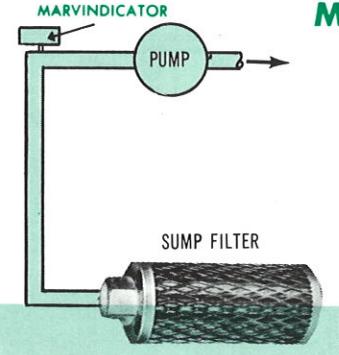

provide immediate warning. The Red Button always pops up at the proper time—whether or not other warning signals are operated from Marvindicator's electrical connections. These electrical connections, either direct terminal or conduit type, can be used to actuate warning lights, audio signals, or for shutting down the entire system. Other important features of the Marvindicator are:

- Installation requires only one pipe connection.
- Repetitive accuracy is fully dependable, highly precise.
- Operation unaffected by condition, nature or viscosity of hydraulic fluids.
- Operates in any position.
- Requires minimum mounting space.

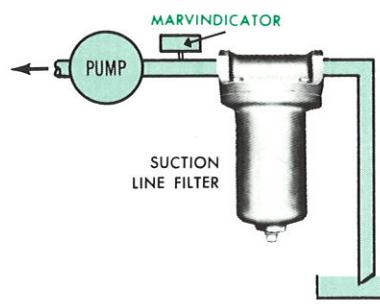

The Marvindicator is available for vacuums of *2" through 9" Hg. and can be used with any voltage up to 110 AC or the equivalent in DC. As indicated on next page, models for Direct and Conduit Electrical Connections are offered.

* Marvindicator vacuum settings are pre-set at the factory and the Marvindicator itself is outwardly designed as apparently un-adjustable as a precaution against tampering. However, the vacuum settings can be changed, if desired, by removing the Marvindicator cover.

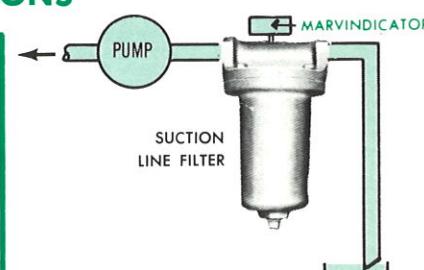

MARVINDICATOR INSTALLATIONS

In Suction Line, Between Sump Filter and Pump

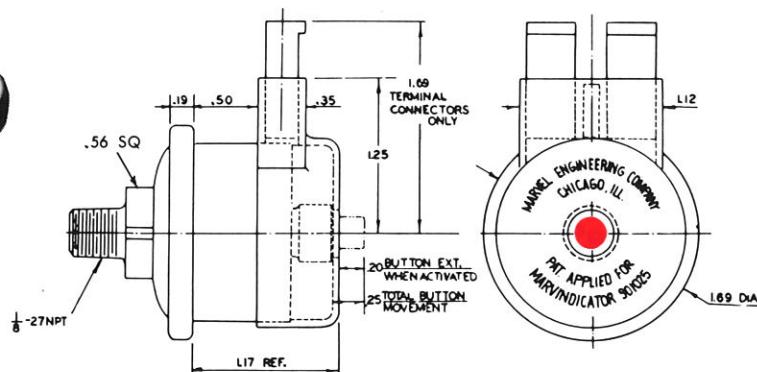

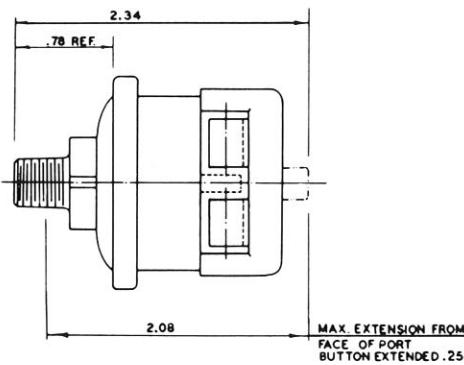

In Suction Line, Between Suction Line Type Filter and Pump

Directly in Head of Suction Filter (when 1/8" NPTF port is provided in Filter Head, on the downstream side of filter element)

DIRECT TERMINAL CONNECTIONS

MODEL NO. 901021 *

HOW TO ORDER MARVINDICATOR

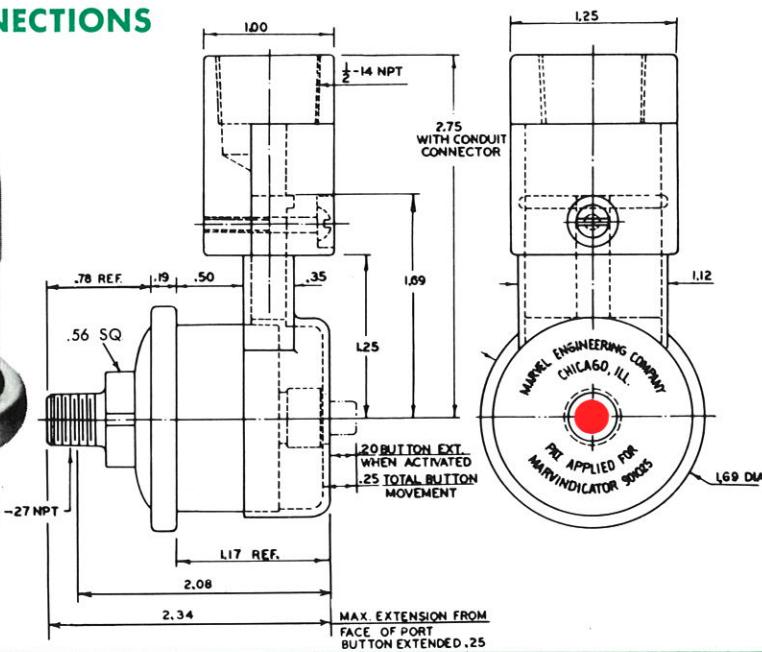

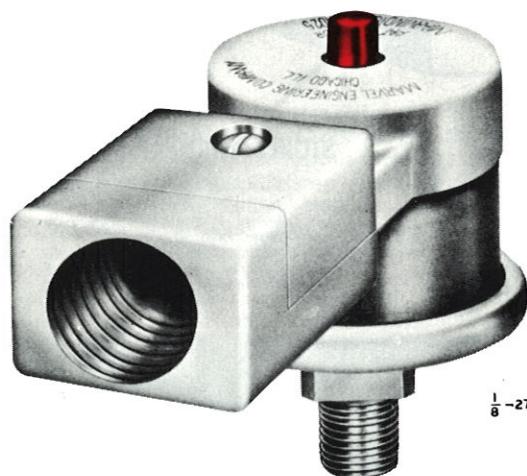

To order, merely specify Marvindicator Model No. followed by the code number of your selected vacuum setting. Example: A Marvindicator set for 4" Hg. and with Direct Terminal Connections would be specified by "Model No. 901021-04."

***VACUUM SETTINGS CODE NUMBERS**

MARVEL "PDC" COLORGAGE ELEMENT CONDITION INDICATOR

For Suction, Return and Pressure Line Type Filters

Helps assure longer element life — better filtration . . . Guards against element collapse . . .

Now—at small cost—any of the *suction, return and pressure line types filters in this catalog can have the remarkable protection against excessive element contamination and malfunction, provided by this ultra-modern, reliable warning system . . . the Marvel PDC Colorgage. It provides a progressive, day-in, day-out indication of precise condition of element—from full clean through clogged, assuring 100% filtration at all times and permitting preventive maintenance in advance of actual need and at a convenient time (such as the next machine shutdown). Thus, the “guesswork” resulting in

costly “too soon” and dangerous “too late” maintenance is eliminated.

The “pressure differential” operating feature of Colorgage is so dependable and so sensitive, it accurately indicates even the slightest changes in upstream-downstream pressure differential. With nothing to adjust or reset in the Colorgage, there's no chance for error—no need for maintenance. And, because of its neat, compact size (1 $\frac{3}{4}$ " x 1 $\frac{3}{4}$ " x 2" high), Colorgage fits most anywhere without adding appreciable weight or bulk (weighs only 2 $\frac{1}{2}$ ozs.).

STURDY, LONG-LIVED CONSTRUCTION

Entire unit completely weatherproof, corrosionproof—encased in protective, all-weather, clear, see-through plastic housing that's extra-tough and shock resistant.

SCREWS fasten PDC Colorgage directly to Marvel Filter or to Mounting Subplate.

DUAL SET OF COLORATOR INDICATING BANDS

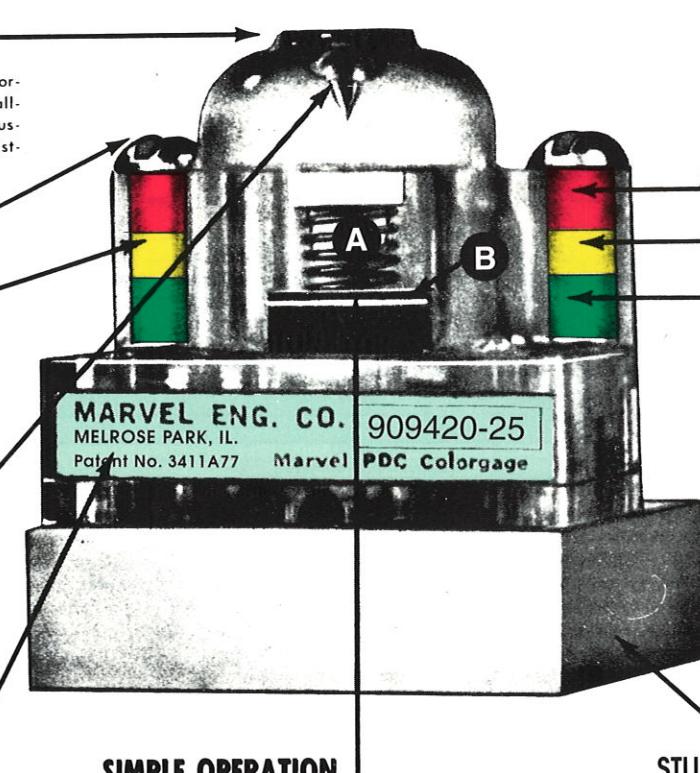

(180° apart) in clear plastic housing assure full, instant visibility from front, left and right at all times.

FLOW DIRECTION ARROW

Permanently molded in (opposite side.) Prevents improper installation when PDC Colorgage Indicator is used as a “remote” indicator.

NAMEPLATE

completely protected and always visible through clear plastic housing.

SIMPLE OPERATION

With clean filter, horizontal white Indicating Line (B) stays lined up horizontally with Green Band. When filter element contamination causes pressure drop at filter “out” port, pressure differential between “in” and “out” ports causes white indicator (B) to move up against spring (A) and line up either with Yellow or Red Band, depending upon degree of contamination.

FAMOUS “COLORATOR” INDICATING BANDS that “talk” (with color)

RED SAYS “STOP”

When horizontal white Indicating Line (B) at top of Black Piston lines up horizontally with any part of RED Band, it says “clean or change element at once or some fluid will by-pass clogging element.” (On non-by-pass filters, “Red” indication is advance warning of dangerous element clogging that could cause system malfunction and often result in complete element collapse.)

YELLOW SAYS “CAUTION”

When white Indicating Line “B” lines up with any part of YELLOW Band, it says “element is becoming contaminated but still providing full-flow filtration (even with integral by-pass type filters). Change or clean element at earliest convenience.”

GREEN SAYS “ALL CLEAR”

When white Indicating Line “B” lines up with any part of GREEN Band, it says “filter element is okay—no cleaning or changing required.”

STURDY MOUNTING BASE OPT.

Solid aluminum mounting subplate with “in” and “out” ports (1/8" N. P. T.) for “in-line” (in parallel with filter) mounting of PDC Colorgage. Four threaded and two drilled holes are provided in subplate for remote control panel mounting of PDC Colorgage (See drawings at top of next page.)

TEMPERATURES—up to 200° F.

PRESURES—150 psi and 1000 psi models with either 25, 15, 10, 8, 5 or 3 psi Indicator Spring Settings as desired.

FLUIDS—For use with petroleum base oils and lubricants. For other fluids, consult our engineering department. Always specify fluid to be used, on your order. Caution: Chlorinated Hydrocarbons not acceptable.

*For Sump Type filter applications, a Marvinicator Vacuum Sensing Indicator is recommended. See pages 24 and 25 for details.

HOW TO SELECT YOUR COLORGAGE

... For Filters WITH By-Pass Valves

- Never select a Colorgage Spring Setting greater than your Filter By-Pass Valve Setting "cracking point" (when Valve begins to open). Marvel Return Line Filter By-Pass Valve Settings are "cracking point" settings (psi).
- Where practical, we recommend the Colorgage Spring Setting equal to the "cracking point" setting of your Filter By-Pass Valve.
- For earlier warning of element contamination, simply select the next lower Colorgage setting from Col. 1 of Table at right. Example: If your cracking point is 15 psi, use a 10 psi Colorgage; if 20, use a 15 psi, Colorgage. If your By-Pass Valve Setting (cracking point) does not correspond exactly with the 10, 15, or 25 psi Colorgage Settings (in Table at right), simply select the next lower Colorgage Setting. Example: If your cracking point is 20 psi, use a 15 psi Colorgage; if 30, use a 25 psi Colorgage.

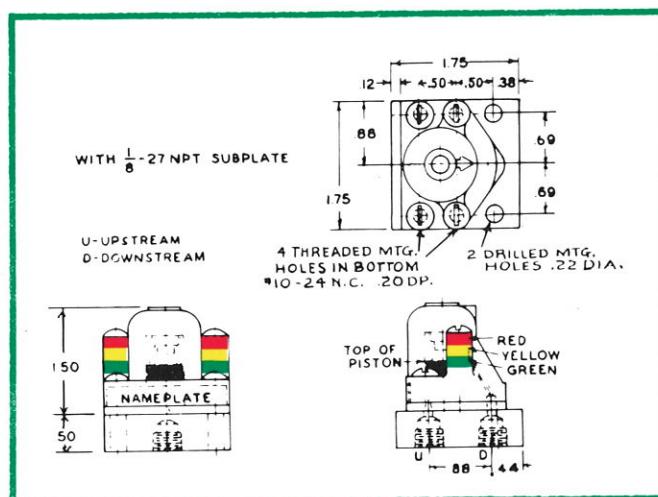

... For Marvel or Other Make Filters Without By-Pass Valves

With Marvel Filters, you can automatically select the 25 psi Colorgage because all Marvel Filters can be operated at this pressure differential without any danger of filter element collapse. However, where your pressure differential through "clean condition" filter is quite low, Colorgage with a lower setting can be used to provide earlier warning of element contamination and to limit the maximum pressure drop through filter (See Col. 3 in Table at right for recommended selections).

SELECTION AND INSTALLATION

Merely select your desired Colorgage Model from Col. 2 of Table at right. Example: for 150 psi Colorgage with 10 psi spring setting, specify "Colorgage Model No. 909221-10."

The sturdy, solid aluminum mounting subplate of the Colorgage has two $\frac{1}{8}$ " NPT ports and six mounting holes (two drilled through holes and four threaded holes), as illustrated in dimension drawings at top right. A versatile choice of mounting methods and locations is available as indicated by Figures 1, 2, 3, and 4 below.

SELECTOR TABLE — MARVEL PDC COLORGAGE INDICATORS

† For Hydraulic oils, coolants, lubricants, water glycol		
Col. 1	Col. 2	Col. 3
PDC Colorgage Indicator Spring Settings	PDC COLORGAGE MODEL NUMBER**	**Max. Recommended "Clean Condition" Filter Pressure Drop PSI (The Greater the difference between figures in Col. 1 & 3, the longer the filter element life)
	Separate or Remote Use (With Subplate)	
	*Max. Operating Pressure	
	1000 PSI	
25 PSI	909421-25	8 to 12 PSI
15 PSI	909421-15	6 to 7 PSI
10 PSI	909421-10	4 to 5 PSI
8 PSI	909421-08	3 to 4 PSI
5 PSI	909421-05	2 to 2½ PSI
3 PSI	909421-03	1 to 1½ PSI

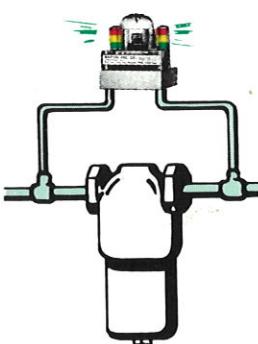

* 4 to 1 Safety Factor.

** Determined by highest flow rate to filter at normal operating viscosity. When Colorgage is used on out-of-doors equipment, white indicating Line (B) in picture, page 26, must be read at normal operating temperatures rather than at "cold start" oil viscosity.

† Pressure (PSI) at which White indicating Line (B) enters red band.

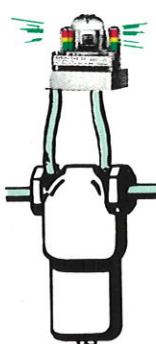

†† When used with Phosphate Ester Base Fluids, simply change dash (—) in Model No. to "X". Example: Colorgage Model No. 909221—25 becomes "909221X25."

Figure 1

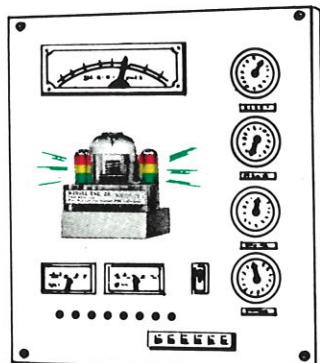

Installation of Colorgage in Suction, Return and Pressure Lines when $\frac{1}{8}$ " NPTF upstream and downstream ports are NOT provided in filter head.

Figure 2

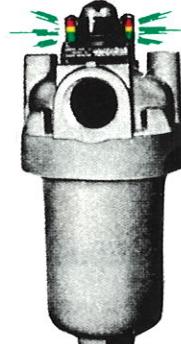

Installation of Colorgage in Suction, Return and Pressure Lines when $\frac{1}{8}$ " NPTF upstream and downstream ports ARE provided in filter head.

Figure 3

The Colorgage connection pipe lines in Figures 1 and 2 can be run to Colorgage mounted on remote control panel.

Figure 4

COLORGAGE INTEGRALLY MOUNTED ON MARVEL FILTERS

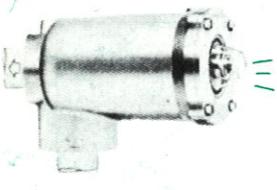

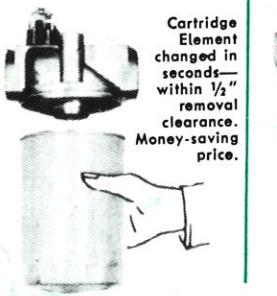

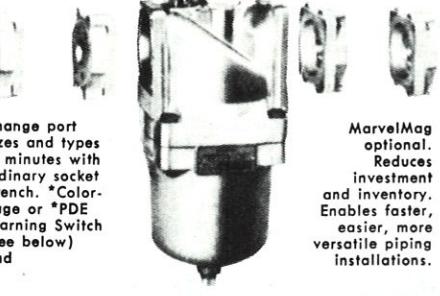

For a wide selection of Marvel Filters with INTEGRAL Colorgage Indicators, see Bulletin T-100. And for more information on Colorgage, see Bulletin CG-102.

Other MARVEL FILTERS

matchless selections for eliminating downtime, repairs, replacements in every type of hydraulic circuit!

Filters up to 200 gpm and 6,000 psi—down to 0.60 microns. Cleanable and throw-away elements. *MarvelMag Magnets and advance-design Indicators for most models.

Quick Delivery! Marvel Filters available in threaded and flange-fitted ports in the most commonly used sizes.

SUCTION	RETURN LINE AND LOW PRESSURE	HIGH PRESSURE	PORTABLE
